Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

/clone_lib="C. reinhardtii CC-1690, Stress condition I,
normalized, Lambda Zap II"
/note="Vector: pBluescript II SK-: Site_l: ECORI; Site_2:
XhOI; This library, constructed by John Davies and Jeffrey
McDemnott, combines cDNAs from CC-1690 cells grown to
mid-log phase in TAP-N (30 min, lhr, 4hr), TAP-S (30 min,
lhr, 4hr), TAP-P (4hr, 12hr, 24hr), NO3 to NH4 (30min, lhr,
4hr) and NH4 to NO3 (30min, lhr, 4hr), PalyA mRNA was
purified from each sample, pooled and cDNA synthesized.
The cDNA was directionally cloned into lambda Zap II
(Stratagene) in the Ecorn (5) and XhOR (3') sites.
pBluescript II SK- plasmids were excised from the lambda
ZAP clones by superinfection with ExAssist (Stratagene)
phage- The library was normalized using method 4 described
in Bonaldo et al (1996) Genome Research 6: 791-806."

                                                                                                                                                                                          The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NG3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the mitviral treatments of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural guidles of the protease and protease: Inhibitor complexes. This sequence contains the alpha-helixo-7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  61 TSINGVLWTVYHGAGTRTIASPKGPVTQMYTNVDKDLVGWQAPQGSRSLTPCTCGSSDLY 120

                                                                                                          The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     61 ISINGVLMIVYHGAGIRIASPKGPVIQMINVDKDLVGWQAPQGSRSLIPCTCGSSDLY 120

These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of they unfection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor complexes. This sequence contains the alpha-helix0-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         120

                                                                                                                                       The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 120

                                                                                                                                                                                                                                                                                                ö
                                                                                                        The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor complexes. This sequence contains the alpha-helix0-1
                                                                                                                                                                                                                                                                                                                                                               TSINGVLWTVYHGAGTRTIASPKGPVTQMYTNVDKDLVGWQAPQGSRSLTPCTCGSSDLY 120

                                                                                                                                                                                                                                                                        The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A well as enabling structural studies of the protease and proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease. This sequence contains the alpha-helix0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      121 LVTRHADVIPVRRRGDSRGSLLSPRPISYLKGSSGGPLLCPAGHAVGIFRAAVSTRGVAK 180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ---
                                                                                                                                  The present sequence is a mutated version of a fusion protein created using the Hepailis C virus (HCV) NG3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NG3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease: Inhibitor complexes. This sequence contains the alpha-helix0-1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antivixal tiveratments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:Inhibitor
                                                                                                                                                  Modified hepatitis C virus (HCV) NS3 protease comprising at least 1 substitution of a hydrophobic alpha-helix 0 amino acid to a hydrophilic amino acid, useful for screening inhibitors that may treat hepatitis C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1 MKKKGSVVIVGRINLSGDTAYAQQTRGEQGCQKTSHTGRDKNQVEGEVQIVSTATQTFLA

                                                                                                                 The present invention describes a covalent hepatitis C virus (HCV) NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4A peptide, a linker, and an HCV NS3 earlie protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present complex. The covalent NS4A NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the ATPase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      122 VTRHADVIPVRRRGDSRGSLLSPRPISYLKGSSGGPLLCPAGHAVGIFRAAVSTRGVAKA 181
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a covalent hepatitis C virus (HCV) NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4A peptide, and an HCV NS3 serine protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present sequence represents a specifically claimed example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the Arpase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  S GSVVIVGRINLSGD -- - TAYAQQTRGEQGCQRTSHTGRDKNQVEGEVQIVSTATQTFLAT

                                                                                                   The present invention describes a covalent hepatitis C virus (HCV) NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4A-NS3 complex. and an HCV NS3 earlie protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3A protease domain. The present sequence represents a specifically claimed example of the above complex. The covalent NS4A 3C complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the ATPase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available.
                                                                                                                                                                                                                                                                                                                             5 GSVVIVGRINLSGD---TAYAQQTRGEQGCQKTSHTGRDKNQVEGEVQIVSTATQTFLAT

                                                                                                                                                                                           NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4A peptide, a linker, and an HCV NS3 serine protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present sequence represents a specifically claimed example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the Arpase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  61
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            81

                                                                                                                                                                                                                                                                                                                                                                                                         NS4A NS3 complex comprising a central hydrophobic domain of native HCV NS4A Peptide, a linker, and an HCV NS3 serine protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present sequence represents a specifically claimed example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NNR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the ArPass activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available.
                                                                                                                                                                                                                                                                                                     61

                                                                                                                                                                    The present invention describes a covalent hepatitis C virus (HCV) NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS3 serihe protease domain, where the hydrophobic domain of native HCV NS3 serihe protease domain, where the hydrophobic domain of native HCV NS3 protease domain. The present to the amino terminus of the HCV NS3 protease domain. The present sequence represents a specifically claimed example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the ArPass activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available.

```
The present invention describes a covalent hepatitis C virus (HCV) NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4 aperide, a linker, and an HCV NS3 earlne protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present sequence represents a specifically claimed example of the above complex. The covalent NS4A NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by MNR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the ATPase activity of NS3. The covalent NS4A NS3 complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available.
                           New hepatitis C virus covalent complexes
                                                                                         Claim 6; Page 80-81; 211pp; English.

A.Molecule type: genomic RNA
A.Residues: 1-547, 'T',549-621,'V',623-624,'S',626-652,'DL',655-761,'T',763-782 A.Cross-references: EMBL:X61591
A.Note: this sequence is inconsistent with the nucleotide translation
A.Note: this sequence is inconsistent with the nucleotide translation
A.Note: the authors translated the codon AGG for residue 43 as Pro, TGG for residue:
as TIP, and TTC for residue 77 as Ser
A.Note: sequence extracted from NCBI backbone (NCBIN:121747, NCBIP:121748)

-: FUNCTION: NSSB IS A RNA-DEPENDENT RNA POLYMERASE THAT PLAYS AN
ESSEMTIAL ROLE IN THE VIROS REPLICATION.
-: CATALYTICA ACTIVITY: Hydrolysis of four peptide bonds in the viral
precursor polyprotein, commonly with Asp or Glu in the P6
position, Cys or Thr in P1 and Ser or Ala in P1'.
-: CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +

-!- FUNCTION: THE SMALL PROTEINS NSZA, NSZB, NSAA AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

-!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 postition, Cys or Thr in Pl and Ser or Ala in Pl'.

-!- CATALYTIC ACTIVITY: N nucleoside triphosphate - N diphosphate +

-I- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4B ARE

HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
                                                                                                                                                                                                                                                                                                                                                MEDLINE-91088550; PubMed-2175903;
